                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents the light chain variable region of the markine anti-human very late antisen, 4 (VLA-4) monoclonal antibody RF1/2. The protein can be used in the method of the invention. The specification describes methods for treating inflammatory bowel disease with a composition comprising an antibody, or its fragments, able to bind to the BI or E2 Spitope of the alpha 4 submit to "VLA-4. The method is usseful for treating ulcerative colitis and Crohn's disease.

This antibody binds albah 4 best littegrin very late antigent 4 Unit of the methods to the set ignor 4 Unit of the methods to the set into the later induced astens. Inhibition of VIM4-latkocyte treat choosis allerger-induced astens. Inhibition of VIM4-latkocyte inflamation prevents secondary effects of lawkocyte infilaration conditions and conditions inflamation yeal mediators or chamches toxins, phones and inhibition of signal transduction causing tralesce of sun-headacors and chamches the agents.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Murine anti-VLA-4 monoclonal antibody HP1/2 VL

In particular, the antegonists are antibodies specific for VLA-1 (very late antigen-1, alpha-1-beta-1 integrin) or VLA-4 (alpha-1-beta-1 integrin) which inhibit the interaction of the integrin and its cognate ligand (collagen I, collagen IV, and lamin in the case of VLA-1, and tiborenetin and VCMM-1 in the case of VLA-1). The method of the invention may be used to treat chronic renal failure, end-stage renal disease, chronic diabetic nephropathy, diabetic renal glomenilopathy, diabetic renal positions, breeditary hypertensive glomenilopathy disease, chronic glomenilosphitis, chreditary hypertensive glomenilopathy and contained the present sequence represents the light magnitus or renal (vepplasia, The present sequence represents the light thain variable region (VI) of the mutue anti-VLA-4 monotonal antibody
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to a method for treating a mammal with or at risk of developing, chronic renal failure, involving the contract of the co

                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to treating inflamancory bound disease (TBD). To comprising a vascular cell adhesion molecule (VCM)-1)/simmosphaking comprising a vascular cell adhesion molecule (VCM)-1)/simmosphaking comprising a vascular cell adhesion molecule (VCM)-1)/simmosphaking composition of the composition is useful to for treating inflamancory bowel disease in a mammal, preferably a human composition is disease for the chronic circles of the composition is desease to the analysis of the composition is administered during an acute transit of the inflamantory bowel disease. The disease force is termed VCMM 2D 196 and comprises 2 N-terminal domains of VCM-1, fused to the human logo heavy chair constant regions, hinge CH2 and CH3.

The present sequence represents the kappa chair variable regions of a consess conjocitional, antibody, 2017.
                                                                                                                                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                A070612 codes for human interleukin-6 binding inhibitor, the polypeptide described in A826812. This polypeptide libbits to binding of human II-6 to its receptor, and can therefore be useful in the treatment of a variety of autoimmune diseases; specifically in the treatment of thousatoid arthritis, seption shock due to bacterial lifection and multiple mysloma. Updated on 25-MAX-2001 to correct PM field.)

abnormal angiogenesis e.g. cancer, ocular neovascular disease, rheumatoid arthritis

The invention relates to an antibody immunologically reactive to candidecin or a frequent of angiogenia courising light and heavy chain endologenia or a frequent of angiogenia relative production with human captured complementarity determining regions having a binding caffinity to the angiogenia or its fragment in combination with human captured polypeptide regions (e.g. mouse monoclonal antibody 62-2F). Also included are an expression vector comprising a nucleic acid encoding the antibody and a host cell transformed with the vector. The antibody or its fragment is useful for inhibiting the angiogenia captured the prohibiting reducing or elaminating a tumour in manney by inhibiting prohibiting, reducing or elaminating a tumour in growth, or inhibiting the ability of circulating tumour cell to form a vacularised tumour meas. The antibody is useful for treating a tumour growth, or inhibiting the ability of circulating tumour cell to form a vacularised tumour meas. The antibody is useful for treating a tumour growth, or inhibiting the ability of circulating tumour cell to form a vacularised tumour meas. The antibody is useful for treating a tumour growth, or inhibiting the ability of circulating cuncer, and other staces are considered tumour meas. The antibody is useful for treating a tumour growth, or inhibiting the ability of circulating cuncer, and other staces are considered tumour meas. The antibody is useful for treating a tumour growth, the second of the constant of the con antibody

 The present sequence is the procein sequence of the heavy chain variable region (W1) of the murine monoclonal antibody SMLA3 (193), which binds specifically to the surface antigens of cartogenic type of streptococcus mutans (ARCC 25175). The monoclonal antibody is produced by SMLA3 (ARCC HB 12558) hybridoma cells. In an example from the invention, chimeric monoclonal antibody TEFF was produced comprising SMLA3 variable regions and human antibody constant regions. Such chimeric monoclonal antibodies can be used to prevent or treat dental cartes in humans. The antibodies engage the effector apparetus of the human insume system when they bind cartogenic organisms, resulting in their destruction. The chimeric antibodies may be produced, in eably be plants, in transgenic animals,
 Streptococcus mutans; monoclonal antibody, Mab; mouse; chameric antibody; therapy; therapy;
 Treatment and prevention of dental caries in mammals, in particular humans by orally administering genetically engineered or purified antibodies that hind to surface antigens of cariogenic organisms -

or in chicken eggs

for oral ingestion

A composition comprising a targeting molety and an anti-microbial peptide moiety useful for treating microbial infections, e.g. on mucosal surfaces, caused by bacteria, rickettsia, fungi, yeasts, protozoa, or parasites

N-PSDB; ABZ58398

2003-229542/22.

Example 1; Fig 4; 53pp; English.

The present sequence is that of a chimeric conscribed via the attimicrobial peptide divari (see also ABP7291) joined via a peptide linker to the heavy chain variable region of SNLA3, a monoclonal antibody made sgisinst the cariogenic expanism such a terperococcus mutans. The chimeric construct shows antimicrobial activity toward 8. mutans strains ATCC 25170; LM 2nd 062779, but not expanism consistency toward 8. mutans strains ATCC 25170; LM 2nd 062779.

 This invention describes novel peptides derived from a framework region of the variable domain of an antibody for detection, immunocheanpy or detect analytes in a sample by aliminating interference in the sample that a fact that a sample of the first analytes in a sample by aliminating interference in the sample. ANES1264-Y51267 represent peptides derived from the framework regions of the variable domain of an antibody which are used to illustrate the

Affile: Structural and functional implications of a restricted antibody respon A; Reference number. A91043; MUID:8630058; MUID:2427335
A; Accession, A27887
A; Molecule type: DNA
A; Residues: 1-112 CCMT;
A; Residues: 1-112 CCMT;
A; Residues: 1-113 cource; strain Balb/c
A; Residues: 1-113 cource; strain Balb/c
C; Comment: This sequence was determined from the germline gene
C; Comment: This chain was solated from a hybridoma protein that binds influenza
C; Superfamily; immunoglobulin v region; immunoglobulin homology
F;16-95/Domain: immunoglobulin homology <1M945
 Ig Mappa chair V region (H37-50) - mouse C;Spectes: Mus mouse thouse mouse) C;Spectes: Mus moustlus (house mouse) C;Date: 13-Dec-1988 Heavance_revision 15-Dec-1988 #text_change 21-Jan-2000 C;Accession: A27837 Excentee, G.G.; Staudt, L.M.; Gerhard, W. Brigol, S. 1577-1587, 1996

 Scoring table:
 Title:
Perfect score:
 OM protein - protein search, using sw model
 Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

 Or The present sequence is that of a single chain by (scFV) derivative of antibody 191/Kz, comprising the heavy (VII) and 161mt (VI) chain variable regions of 193/Kz 79 inted by an artificial, flexible linker peptide. The scFV was obtained by PCR smplification of cDNAs for 193/Kz 194 and VI regions and cloning in vector phaps. 193/KZ is antibodies of that imment sector in FITY/INSERIVATE ARCOLF IN (FITA) of the scenario of the school of the schoo

 The invention relates to a blosynthetic antibody binding site that comprises disulfide bonded heavy, light variable region (FWR, LVR) defining single, complete antigen (AgI) binding site. HWR, LVR have polyperise domain having sets of complementarity determining regions (CRR) and framework (FR) amino acid sequences homologous to first and second immunoplobulin, respectively. The blosynthetic antibody binding sites are useful in specific binding assays, affinity purification, bloomthytis, drug targeting, imaging hammological treatment of various recommended infectious diseases. The present sequence represents the companies of th

 Mouse monoclonal antibody alpha 340 light chain variable (VK) region.
 Cowasalons is a hapten used for studying the immune response and the anti-oxasalone antihody. Will, has been described by E. Gheradi, R. Fannell, and C. Milstein, U. Immunol. Method 126 61-69). A plasmid contg, the VH and VL genes of WOll was converted to the sery form by inserting the BstEII/SacI fragment of serVoll.3 myc (mucleotides 432-439 of AdQ1095) between the VH and VL genes to generate into Griphy MI ges AdQ1095) to generate pub Woll. The specific binding see tho Milstein AdQ1095 to generate pub Woll.

The specific binding see also MARC1095 to 93112 AMR22450, 565-581.

New humanized form of mouse monoclonal antibody 340 which binds to epidermal growth factor receptor and inhibits binding of growth factor, useful for treating colorectal, lung, breast, gastric and overlan

Claim 6; Fig 2; 53pp; English

or The present invention relates to a humanised form of the antibody 340 (a course monotonal antibody which binds to egidermal growth factor (EGP) or receptor and inhibits binding of EXP), obtainable from the coll line of deposited with the EXACC under accession number 97021438. The humanised come form of the antibody 340 is useful in gene therapy, medicine and in the communicative of a medicament for treating to propely asks of cancer. The invention is useful for treating colorectal, lung, breast, pastric or convertion oncers or also for preventing the recurrence of cancer after intial treatment or surgery. The invention is also useful for enhancing procestive immuse response against cancer by optimised immunication and procestive humanised form of the antibody and has reduced communicative but subset shall mention that the colls expressing EXP remaining the colls of the control of the surface of the colls of the control of the surface of the colls of the control of the surface of the colls of the control of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the colls of the col Sequence 112 AA;
